Wright A;

WPI; 2001-663057/76.

Diagnosing disease or predisposition to disease, associated with disease causing mutations in retinitis pigmentosa GTPase regulator gene by genotyping ORF15 of the gene, and determining presence of mutations.

Disclosure, Fig 4E; 100pp; English.

The present invention relates to a method for diagnosing disease or predisposition to a disease, associated with a disease causing mutations in a retinitis pigmentosa GTPase regulator (RPGR) gene involves genotyping a RPGR gene, and determining whether the genotype comprises a

```
ö
disease causing mutations, where the risk genotype is present within open detecting frame (ORF)15 of the RPGR gene. The method is useful for detecting a certain disease state e.g., X-linked retinitis pigmentosa (XLRP). The kit is useful for detecting and measuring disease causing mutations in biological fluids and tissues and for localising mutation in tissues. The mutant RPGR gene is useful in gene therapy techniques and for screening agents capable of affecting the expression of the sequences and/or the biological activity of mutant RPGR. They are preferably useful for identifying agonists and antagonists of RPGR. The mutant RPGR gene is also useful in identification of potential pharmacoutical targets in high throughput screening assays and forensic analysis. The present sequence is the imperfect direct repeat of human RPGR exon ORF15 repetitive DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cloning and expression of PUR protein, involved in regulation of DNA replication - also oligo:nucleotide(s) and antibodies for use in the treatment of proliferative diseases, e.g. cancer.

PUR elements are purine-rich 24 nucleotide DNA sequences which occur at eukaryotic origins of replication and 5' flanking regions of some cellular oncogenes. The PUR protein (AARS0310) was originally identified as a 27kD HeLa cell nuclear factor that bound in a sequence-specific manner to a major site of DNA bending located 1.6kb.upstream of the transcription start site of the human c-myc gene; the site recognised by PUR protein had the sequence AAQ44801. ```
sequence element found 1.6kb upstream of the cellular c-myc gene. The PUR element (see AAQ4801) is located in a region of DNA bending activity which is a structural feature often associated with origins of DNA creplication. The PUR protein AAR50310 binds to the PUR element. (Updated on 25-MAR-2003 to correct PN field)

protein and its fragments - that inhibit PUR protein binding to PUR
                                                                                                                                                                               the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections
                                                                                                                                                                   This is the nucleotide sequence of the PUR element used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PUR-alpha gene; inhibition; viral infection; cancer; PUR element; hyperproliferative disease; ss.
                                                                                                                                                                                                                                                    Sequence 24 BP; 8 A; 0 C; 14 G; 2 T; 0 U; 0 Other;

Isolated sequences were then used as probes to screen an expression library for sequences encoding the PUR protein. The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may

This is the nucleotide sequence of an oligonucleotide used in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases such as cancer
protein binding to PUR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB 2; Length 24;

The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR gene. The present sequence represents an oligomucleotide used in the identification and characterisation of the PUR protein and its sequence element PUR repeat, in an example from the
               Oligonucleotide MR0700 used in PUR identification/characterisation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hyperproliferative diseases such as cancer. FUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or mutations in the PUR gene. The present sequence represents an oligonucleotide used in the identification and characterisation of the PUR protein and its sequence element PUR repeat, in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

determining the hybridization of a capture probe to a treated sample amplification products and the untreated sample amplification products and the untreated sample amplification products and the untreated sample amplification products. Specifically, the method comprises preparing a chromatin sample from cells, the chromatin sample comprising genomic DNA segments or genomic DNA with one or more open chromatin sites; treating a first portion of the chromatin sample with an open chromatin DNA cleaving agent to produce fragments; performing a first amplification reaction using the fragments as a substrate, to produce treated esample amplification products; performing a second amplification reaction using a second portion of the chromatin sample, where the second portion is not treated samplification of the chromatin DNA cleaving agent, to produce untreated-sample amplification products with a capture probe; and cherming the hybridization of the capture probe; and where reduced hybridization of the capture probe; and where reduced hybridization of the capture probe to the products of the capture probe to the untreated sample amplification products approbe to the untreated sample amplification products are checked sample amplification products and the capture probe to the untreated sample amplification of the capture probe to the untreated sample amplification products indicates the presence of open chromatin in the genomic DNA. Also given the capture probe to the untreated sample amplification group chromatin state profiling array, for detecting the presence of open chromatin in genomic DNA, used in the diagnostic and prognostic methods, and are useful for monitoring the presence of open chromatin in genomic DNA. The methods and chromatin at a companion of the untreated sample amplification products are useful for detecting open chromatin in genomic DNA, used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           treatment and evaluating the response of cells and patients to candidate or established therapeutic agents. The present sequence is a 3' reverse primer for one-sided PCR amplification of DNase I treated chromatin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          new invention relates to detecting open chromatin in genomic DNA by
                                                                                                                                                                                                                                                                                                                                                                                             Detecting open chromatin comprises determining hybridization of or capture probe to the treated- and untreated-sample amplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       fragments, deposited on a chromatin profiling array

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered to contains a heterologous functional domain that provides altered to comprise assay. The enzyme comprises a 5' nuclease, preferably a thermostable 5' nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that confirmed polymerase is a conformation of the nuclear of thermostable polymerase from a Thermus species such as T. aquaticus, T. flaivus, T. filiformus or T. scotoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage assay and an amino acid sequence that provides improved background specificity in the nucleic acid cleavage structure comprises a RNA target nucleic acid (a cytochrome Cereavage structure comprises as RNA target nucleic acid (a cytochrome PSSO, or cytokine RNA). Cleavage product, which is then detected by detecting radioactivity luminescence, mass or fluorescence energy transfer or by detecting radioactivity luminescence, plosphorescence, fluorescence colarage. The enzyme is useful for cleavage asposing a sample (a cell lysate) comprising substrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleic acid to the enzyme which produces at least one detectable cleavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or lants that are or may be associated with disease or other conditions. In addition, the enzymes may be useful for
                                                                                                                                                                                                                                                                                                                                                 Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 detecting and identifying strains of microorganisms including bacteria, fungi, protozoa, ciliates and viruses, preferably detecting and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel composition comprising an enzyme which contains a hererologous functional domain that provides altered contains a hererologous functional domain that provides altered contains a hererologous functional domain that provides altered in containality in a nucleic acid cleaves easey. The enzyme comprises a 5' conclease, preferably a thermostable 5' nuclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a polymerase such that it exhibits reduced DNA synthetic activity from that of thermostable polymerase from a Thermus species such as T. aquaticus, T. flavus, T. thermophilus, T. filiformus or T. scotoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid cleavage sasay and an amino acid sequence that provides improved cleavage structure comprises a RNA target mucleic acid (a cytochrome Cleavage structure comprises a RNA target mucleic acid (a cytochrome Cleavage structure comprises a RNA target mucleic acid (a cytochrome Cleavage structure comprises a RNA target mucleic acid (a cytochrome CC qenerates an non-target cleavage product, which is then detected by detecting radioactivity luminescence, phosphorescence, fluorescence CC which involves exposing a sample (a cell lysate) comprising substrate cucleic acid to the enzyme is employed for detecting target DNAs and cleavage product. The enzyme is employed for detecting cleavage product. The enzyme is employed for detecting farget DNAs and cleavage product. The enzyme is employed for detecting farget DNAs and cleavage product. The enzyme is employed for detecting farget DNAs and disease or other animal or plants that are or may be associated with disease or other conditions. In addition, the enzyme is remptored.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          including bacteria,

This invention describes a novel composition comprising an enzyme which contains a heterologous functional domain that provides altered contains a heterologous functional domain that provides altered contains in a nucleic acid cleavage assay. The enzyme comprises a 5' muclease, preferably a thermostable 5' muclease, or a polymerase which is altered in sequence related to a naturally occurring sequence of a colymerase such that it exhibits reduced DNA synthetic activity from that of the naturally occurring polymerase. Preferably the polymerase is a chermostable polymerase from a Thermus species such as T. aquaticus, T. Clavus, T. thermophilus, T. filiformus or T. scotoductus. The enzyme comprises a heterologous functional domain, an amino acid sequence that provides an improved substrate binding activity in the nucleic acid (a cytochrome package assay and an amino acid sequence that provides improved cleavage structure comprises a RNA target nucleic acid (a cytochrome P450, or cytokine RNA). Cleavage product, which is then detected by detecting radioactivity luminescence, phosphorescence, fluorescence comprisation or charge. The enzyme is useful for cleavage structure comprises. The enzyme is useful for cleavaing a nucleic acid cother enzyme which produces at least one detectable cleavage product. The enzyme is employed for detecting target DNAs and RNAs comprising wild-type and mutant alleles of genes including genes from humans, other animal or plants that are or may be associated with disease or other conditions. In addition, the enzyme any beatsymes and beatsymes and any plants any plants and any plants any plants and any plants any p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   detecting and identifying strains of microorganisms including bacteria,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Composition comprising enzyme which comprises heterologous functional domain that provides altered functionality in nucleic acid cleavage assay, useful for cleaving nucleic acid, and detecting presence of RNA
                                                                                                                                                                                                                                                                                                                                                      Hall JG;

encoding an N-terminal peptide (AAR71610) from the novel potato (Solanum tuberosum) ATP-dependent fructose-6-phosphate 1-phosphotransferase enzyme (BC 2.7.1.11; PFK). The probe was used to obtain 11 clones of the PFK gene. These clones, amplified by PCR using the primers (AAQ85990-3), ligated into the plasmid pBluescript SKII(-). The full length gene (AAQ85982) was used to generate the expression vector pPFK(35S) which was transformed into plants via Agrobacterium tumefaciens. Transformed plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expressing the enzyme can be used to produce varieties that have alrered sugar content on storage at low temperatures. Derivatised solid supports and reagents for oligo:nucleotide synthesis - and new oligo:nucleotide phosphoramidate conjugates. WPI; 1996-010846/01

This invention describes novel derivatised solid supports of formula S'-L-Z-CH2CH2-R, where: S' = a solid support; L = a bond or an (in) organic linker; Z = SO2 or S-S; R = OH, an H-phosphonate, alkanephosphonate, phosphotriester, phosphite triester, phosphoramidate or phosphoramidate group, or an optionally substituted or modified nucleotide (N'), or an oligonucleotide of formula (N')R2; g = 1-200; R1 = a protecting group; R2 = an H-phosphonate, phosphorate, phosphite triester, phosphite triester, phosphite diester, phosphoramidate or phosphoramidite group, OH, OR1, SR1 or Disclosure; Page 48; 68pp; English

phosphoramidate or phosphoramidite group, OH, OR1, SR1 or
CCC CPCH2CH2ZCH2CH2CR1. Also mentioned are compounds of formula
CCC CPCH2CH2ZCH2CH2CR2CR1. Also mentioned are compounds of formula
CCC R3GH2GH2ZCH2CH2CH2R4, where: R3 = a protecting group; and R4 = OH or an HCCC Phosphorate, alkanephosphorate, phosphoriester, phosphite triester,
CCC phosphoramidite group. Also claimed are new phosphoramidates, a
CCC process for preparing an oligonucleotide 5'-phosphate, a process for
CCC proparing a solid support useful for preparation of an oligonucleotide 3'
CCC phosphate, a process for preparing an oligonucleotide 3'-phosphate and a
CCC process for preparing an oligonucleotide 3'-phosphate and a
CCC process for preparing an oligonucleotide 3'-phosphate and a
CCC process for preparing an oligonucleotide 3'-phosphate and
CCC oligonucleotide 3'- and/or 5'-phosphates may be used to prepare DNACLASCHING OR - binding agents. The process for preparing oligonucleotide
CCC cleaving or -binding agents. The process for preparing oligonucleotide
CCC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates is a simple and suitable for use in automatic DNA
CSC 3',5'-diphosphates by a sequence represents a fragment of the HIV-1 provins

No, is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMMENT
                                                                                                                                                 ORIGIN
                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of public [4]4732114[gb]AR129072.1), a copy number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XII.0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alkharouf, N., Khan, R. and Matthews, B.

/note="Vector: PWD42nv; Purified genomic DNA from M. musculus CS7BL/6J (male) was obtained from the Jackson Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonicleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AP129072.1), a copy-number
with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xili0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    5

inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch oritice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pMDA2 (gif #732114|gp|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

Description

```
gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ08152) each having 50 base pairs (bp). The system is useful for leukcoyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient, predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus,

Van Rensburg EJ; Engelbrecht S, Zur Megede J, Barnett SW, WPI; 2002-154920/20. New polynucleotides encoding antigenic HIV Type C polypeptides, useful applications including DNA immunization or generation of packaging cell lines, particularly in gene therapy.

Example 1; Fig 44; 233pp; English.

The present invention describes expression cassettes comprising a polymorlectide sequence encoding a polympetide comprising immunogenic HIV type C polypeptides. The expression cassettes comprise any of the HIV type C polypeptides. The expression cassettes comprise any of the HIV type C sequences encoding Gag, Pol, Vif, Vpr, Tat, Rev, Vpu, Env or Nef (I). (I) have immunostimulant activity and can be used in gene therapy. The HIV type C polymorlectides are useful in applications including DNA immunisation, generation of packaging cell lines, and production of HIV Type C proteins The polymuclectides are particularly useful in gene Herapy and DNA immunisation applications. ABL19991 to ABL40054 and ABB06215 represent sequences used in the exemplification of the present invention. (Updated on 29-AUG-2003 to standardise OS field)

New expression cassette comprising a polynucleotide sequence encoding an HIV Pol polypeptide, useful in eliciting an immune response, in DNA immunization, generating of packaging cell lines or in producing HIV Type proteins

Example 1; SEQ ID NO 73; 160pp; English

The invention relates to an expression cassette comprising a polynucleotide sequence encoding an HIV Pol polypeptide. The invention also relates to a recombinant expression system for use in a host cell comprising an expression cassette, where the polynucleotide sequence further comprises control elements capable of driving expression in the selected host cell, a cell comprising an expression cassette where the polynucleotide sequence further comprises control elements compatible with the expression in the cell and a composition for generating an immunological response, comprising an expression cassette. The expression cassette and the methods of the invention are useful in eliciting an immune response, in DNA immunisation, in generation of packaging cell lines and in producing HIV Type C proteins. This sequence represents an HIV-1 polynucleotide of the invention.

messenger RNAs that populate a (sub-)transcriptome, where the sub-
C transcriptome comprises messenger RNAs transcribed from multiple
transcription units that populate a genome. The library comprises several
coligonucleotides, each capable of hybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
coligonucleotide libraries are useful for detecting mRNAs from a
biological sample, in expression profiling studies, in qualitatively or
cymanticatively characterising the corresponding transcriptome, and in
chetcting RNA transcripts and splice variants of human or animal
transcriptomes. The libraries may also be used as specialised mini
colipogical or detect transcripts of a sub-transcriptome under a particular
biological or pathological state, and so allowing the detection of tissue
and pathology-specific genes such as those genes only expressed in
specific tissue under a specific pathological condition; to detect

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel isolated protein which comprises a human mannosyl transferase having the same sequence as the fully defined oli- or 255-amino acid sequence or its fragment. The invention may be useful for the production of compounds with an antimanic or antidepressant activity whilst the disclosed sequences may be used for gene therapy. The invention also provides a human mannosyl transferase fusion protein and a chromosome 9 fusion protein, both of which result from a chromosome 11 translocation. The human mannosyl transferase and the fusion protein are useful for diagnoshing or predicting the modulates the activity of a mannosyl transferase. The present sequence is that of a region of human DNA surrounding a single nucleotide than invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for

New single-stranded nucleic acid, useful in parallel production of synthetic genes, includes a sequence containing type IIS enzyme recognition site and a defined sequence.

Disclosure; Fig 7; 69pp; German.

This invention describes the novel use of a single-stranded nucleic acid, tor use in preparation of nucleic acid comprising a part (A) comprising the sequence of a recognition site for a type IIS restriction enzyme, or the sequence of a recognition site for a type IIS restriction enzyme, or the formula of comprises preparing an oligomuclectide (ONI), optionally by modification of an oligomuclectide linked to a surface, that contains the recognition site for fragment or complement) of a type IIS enzyme that cuts outside its recognition sequence to generate a single-stranded overhang. ONI is ligated with the single-stranded nucleic acid, particularly where part (A) is complementary to the overhang, to form a 5'-overhang, which is filled in. A second oligomucleotide (ONZ), comm a 5'-overhang, which is filled in. A second oligomucleotide (ONZ), comm a 5'-overhang, which is filled in. A second oligomucleotide (ONZ), complementary to the overhang and comple-stranded oligomucleotides (ONI) onl) with a 3'-overhang and constrained by part (A) complementary to the single-stranded nucleic acid consisting of part (A) complementary to the single-stranded nucleic acid consisting of part (A) complementary to the single-stranded nucleic acid, their same for all members of a group, and a 2 or 3-nf (B) that is different for each member of the agroup, and a 2 or 3-nf (B) that is different for each member of the group of this seep are then cleaved with the type IIS enzyme that is product from one group ligated with those of the other group. The groups of single-stranded nucleic acid, their 5'-ends filled in and the product from one group ligated with those of the other group. The margner recognition site for coupling to a matrix. The enzyme recognition of the method comprises ligating two partially and the overhang or entirely in the overhang or entirely in the double-stranded region of ONIO was only with 5'-overhang sof 3 nt which in the overhang or entirely in the encognition site for type IIS enzyme same for matrix. The enzyme ON21 type. The same process is used to produce another ONe and the two final ONe are ligated in an orientation determined by blockade of the ends that are not intended for ligation. The product of this step is then cleaved with an type IIS enzyme that cuts in either of the ONe. The enzyme used creates a 3 nt overhang, except in the last repetition of the process leading to ONe, where it creates an overhang of other than 3 nt. the product cleaved with the enzyme appropriate for ON21 and the resulting extended oligonucleotide (ONe) is separated and optionally the procedure repeated sequentially with additional oligonucleotides of the

The nucleic acids are used to prepare nucleic acids, particularly synthetic genes, or nucleic acid libraries, particularly by sequential ligation of oligonucleotides in parallel reactors, in sequence-independent manner. The products of the invention makes possible sequence-independent nanner. The products of the invention makes possible sequence transfer components, i.e. an oligonucleotide library of relatively low complexity. This reduces the effort involved in producing a complete library of sequences, without problems of low ligation efficiency associated with 1 or 2 nucleotide overhangs, and the use of short oligonucleotides improves both yield and purity. The proportion of broken and failed sequences is reduced and many gene variants can be prepared simultaneously. This sequence represents a polynucleotide used to make the Type IIS restriction enzyme constructs used to illustrate the method of the invention. \$

Determining neurotrypsin inhibitor compound involves incubating compour with neurotrypsin having protease domain, and agrin peptide comprising specified cleavage site; in aqueous buffer, and measuring amount of cleavage of agrin.

Example 20; SEQ ID NO 8; 91pp; English.

The invention describes a method of determining a neurotrypsin inhibitor compound involves: (a) incubating the compound with neurotrypsin, its variant or fragment comprising the protease domain of neurotrypsin, and protein or peptide comprising agrin, its variant or fragment comprising cleavage site between arginine 995 and alanine 996, or lysine 1754 and

```
catalytic activity of neurotrypsin involving: incubating neurotrypsin, its variant or fragment comprising the protease domain with a protein or peptide comprising agrin, its variant or fragment comprising the cleavage site of agrin, in an aqueous buffer solution; and mesuring the amount of cleavage of agrin, and neurotrypsin inhibitor compounds of formula (I) and its addition salts. The method is useful for: determining a prophylaxis of diseases caused by deficiency of synapses, skeletal muscle atrophy, schizophrenia and conjulive disturbance; for measuring catalytic activity of neurotrypsin; and for impairment of cognitive functions in patients with Alzheimer's disease, Parkinson's disease, multiple

New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmentalspecific genes

Example 1; SEQ ID NO 26691; 47pp; English.

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or

Disclosure; SEQ ID NO 814; 282pp; English.

The invention relates to a standardising control for RNA samples to be tested on non-control gene sequences on nucleic acid arrays, comprising a pool of unique tagged synthetic antisense mRNA molecules of a known concentration, where agequences are unique if their sequences differ. The non-control gene sequences on the nucleic acid array comprise

```
channel proteins, transport proteins, intracellular signal transduction modulator and effector factors, transcription factors, DNA-binding proteins, receptors or cell-cell communication proteins, stress response genes, apoptosis related genes DNA synthesis/recombination/repair genes and DNA-binding proteins. The genes encoding receptors comprise receptors for growth factors, chemokines, interleuxins, interferons, hormones, neurotransmitters, cell surface antigens or cell adhesion molecules. The genes encoding cell-cell communication proteins comprise growth factors, chemokines, interferons or hormones. The standardising control for RNA samples to be tested on non-control gene sequences on nucleic acid arrays is useful for producing a population of distinct antisense RNA molecules from an initial population of distinct

New system for leukocyte expression profiling, diagnosing a disease, or monitoring (the rate of) progression of a disease, e.g. atherosclerosis or congestive heart failure, comprises diagnostic oligonucleotides. Claim 1; Page 506; Opp; English..

The invention relates to a system for detecting gene expression, which comprises one or two isolated DNA molecules that detect expression of a gene, where the gene corresponds to any of 8143 oligonucleotides (ABZ00010-ABZ0812) each having 50 base pairs (bp). The system is useful for leukocyte expression profiling. It is particularly useful for diagnosing a disease, monitoring (rate of) progression of a disease, predicting therapeutic outcome, determining prognosis for a patient,

Also described are: a method of classifying an individual with a condition having good prognosis or poor prognosis; a method of classifying breast cancer patient having good prognosis; a method of assigning individual to several categories in clinical trial; a method of identifying set of genes informative for condition; a method of predicting breast cancer patient with good prognosis or poor prognosis; a microarray; and a microarray kit. The method is useful for identifying informative genes or marker for disease on the phenotypic or genotypic characteristics of the disease condition e.g. cancer, into several classes. A set of genes or marker informative for the condition is identified within each classes, such that the set o predicting disease complications in an individual or monitoring response to treatment in an individual. The diseases include cardiac allograft rejection, kidney allograft rejection, liver allograft rejection, atherosclerosis, congestive heart failure, systemic lupus erythematosus, Method of identifying informative genes or marker for breast cancer, involves identifying set of genes or marker informative for condition, each classes such that set of genes in each classes is unique to class relative to other classes. ER/AGE. The cellular constituent profile is used to determine patients suitable for clinical trials of a drug for treating breast cancer and determining if the patient is a good or poor candidate for chemotherapy. The method enables improved and high sensitive prediction of the responsiveness of a breast cancer patient to chemotherapy. The present sequence is a fragment of a human cDNA whose differential expression level makes it a candidate for the cellular constituent profile.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apoptosis related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, Gprotein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.

Predicting responsiveness of breast cancer patient to chemotherapy based on patient's cellular constituent profile, comprises measurement of cellular constituents, estrogen receptor (ER) level and ER level relative

WPI; 2006-613101/63

Disclosure; SEQ ID NO 140; 349pp; English

to patient's age

The invention relates to predicting responsiveness of a breast cancer patient to chemotherapy, comprising predicting the patient to exhibit enhanced response to chemotherapy as compared to patients in the general population of breast cancer patients if the cellular constituent profile is a poor prognosis profile, and the estrogen receptor (ER) level is ER+ and the ER level relative to patient's age (ER/AGE) is low. Also included are selecting a patient for enrollment in a clinical trial of a drug for treating breast cancer (based on the cellular constituent profile, ER level and an ER/AGE), identifying a breast cancer patient as a good or poor candidate for chemotherapy (based on the cellular constituent profile, ER level and an ER/AGE) and a computer system and program for carrying out the predicting, selecting and identifying methods. In the predicting method, the ER level is determined by methods. In the predicting method, the ER level is determined by encoding the ER is the ERalpha gene. The estrogen receptor level is encoding the ER is the ERalpha gene. The estrogen receptor level is using cyclophosphamide, methotrexate and 5-fluoruracil. The method is useful for predicting responsiveness of a breast cancer patient to chemotherapy based on measurement of cellular constituents, ER level and

The present invention relates to oligonucleotides encoding polymorphic variants of proteins related to amylases, amyloid proteins, angiopoietin, apptocia's related proteins, cadherin, cyclin, polymerase, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Groteins, cytochromes, kinesins, cytokines, interferons, interleukins, Grotein coupled receptors and thioseterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatooid arthritis, multiple sclerosis, diabetes, cystemic lugue erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic
                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     neuroprofective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; collony stimulating factor; complement related protein; cytochome; kinesin; cytokine; interferon; interleukn; G-protein coupled receptor; thioesterase; inflammation; multifactorial disease; autoimmune disease; infection;

The antisense oligonucleotide analogs (ONS) have a sequence complementary to a sequence of nucleotides 415-445 of human papilloma virus-16 (HPV-16). The antisense ONS can be used to inhibit expression of HPV gene Es/B7 in living cells, preferably human keratinocytes or human cervical cells. They bind to Es/E7 mRNA in the cell, prevent mRNA translation and promote mRNA degradation by intracellular RNASe H. They can be used for preventing transformation of living cells by HPV. The antisense ONS are used particularly for inhibiting the growth of cervical tumours

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description
